BGP Best Current Practices

ISP Training Workshops

Configuring BGP

Where do we start?

IOS Good Practices

- ISPs should start off with the following BGP commands as a basic template:

  ```
  router bgp 64511
    bgp deterministic-med
    distance bgp 200 200 200
    no synchronization
    no auto-summary
  ```

  Replace with public ASN

  Make ebgp and ibgp distance the same

- If supporting more than just IPv4 unicast neighbours

  ```
    no bgp default ipv4-unicast
  ```
  - is also very important and required

Cisco IOS Good Practices

- BGP in Cisco IOS is permissive by default
- Configuring BGP peering without using filters means:
  - All best paths on the local router are passed to the neighbour
  - All routes announced by the neighbour are received by the local router
  - Can have disastrous consequences
- Good practice is to ensure that each eBGP neighbour has inbound and outbound filter applied:

```
router bgp 64511
 neighbor 1.2.3.4 remote-as 64510
 neighbor 1.2.3.4 prefix-list as64510-in in
 neighbor 1.2.3.4 prefix-list as64510-out out
```

What is BGP for??

What is an IGP not for?

BGP versus OSPF/ISIS

- Internal Routing Protocols (IGPs)
  - examples are ISIS and OSPF
  - used for carrying **infrastructure** addresses
  - **NOT** used for carrying Internet prefixes or customer prefixes
  - design goal is to **minimise** number of prefixes in IGP to aid scalability and rapid convergence

BGP versus OSPF/ISIS

- ❑ BGP used internally (iBGP) and externally (eBGP)
- ❑ iBGP used to carry
  - some/all Internet prefixes across backbone
  - customer prefixes
- ❑ eBGP used to
  - exchange prefixes with other ASes
  - implement routing policy

BGP versus OSPF/ISIS

□ DO NOT:
- distribute BGP prefixes into an IGP
- distribute IGP routes into BGP
- use an IGP to carry customer prefixes

□ **YOUR NETWORK WILL NOT SCALE**

Aggregation

Aggregation

- Aggregation means announcing the address block received from the RIR to the other ASes connected to your network

- Subprefixes of this aggregate may be:
  - Used internally in the ISP network
  - Announced to other ASes to aid with multihoming

- Unfortunately too many people are still thinking about class Cs, resulting in a proliferation of /24s in the Internet routing table
  - Note: Same is happening for /48s with IPv6

Configuring Aggregation – Cisco IOS

- ISP has 101.10.0.0/19 address block
- To put into BGP as an aggregate:

```
router bgp 64511
  network 101.10.0.0 mask 255.255.224.0
  ip route 101.10.0.0 255.255.224.0 null0
```

- The static route is a "pull up" route
  - more specific prefixes within this address block ensure connectivity to ISP's customers
  - "longest match lookup

Aggregation

- Address block should be announced to the Internet as an aggregate

- Subprefixes of address block should NOT be announced to Internet unless for traffic engineering
  - See BGP Multihoming presentations

- Aggregate should be generated internally
 - Not on the network borders!

Announcing Aggregate – Cisco IOS

- Configuration Example

```
router bgp 64511
 network 101.10.0.0 mask 255.255.224.0
 neighbor 102.102.10.1 remote-as 101
 neighbor 102.102.10.1 prefix-list out-filter out
!
ip route 101.10.0.0 255.255.224.0 null0
!
ip prefix-list out-filter permit 101.10.0.0/19
ip prefix-list out-filter deny 0.0.0.0/0 le 32
```

Announcing an Aggregate

- ISPs who don't and won't aggregate are held in poor regard by community
- Registries publish their minimum allocation size
  - Anything from a /20 to a /22 depending on RIR
  - Different sizes for different address blocks
- No real reason to see anything longer than a /22 prefix in the Internet
  - BUT there are currently (June 2012) >216000 /24s!
- But: APNIC changed (Oct 2010) its minimum allocation size on all blocks to /24
  - IPv4 run-out is starting to have an impact
Aggregation – Example

100.10.10.0/23
100.10.0.0/24
100.10.4.0/22
…

Internet

AS100

customer

100.10.10.0/23

- Customer has /23 network assigned from AS100's /19 address block
- AS100 announces customers' individual networks to the Internet

Aggregation – Bad Example

- Customer link goes down
  - Their /23 network becomes unreachable
  - /23 is withdrawn from AS100's iBGP
- Their ISP doesn't aggregate its /19 network block
  - /23 network withdrawal announced to peers
  - starts rippling through the Internet
  - added load on all Internet backbone routers as network is removed from routing table

- Customer link returns
  - Their /23 network is now visible to their ISP
  - Their /23 network is re-advertised to peers
  - Starts rippling through Internet
  - Load on Internet backbone routers as network is reinserted into routing table
  - Some ISP's suppress the flaps
  - Internet may take 10-20 min or longer to be visible
  - Where is the Quality of Service???

16

Aggregation – Example

100.10.0.0/19

100.10.0.0/19
aggregate

Internet

AS100

customer

100.10.10.0/23

- Customer has /23 network assigned from AS100's /19 address block
- AS100 announced /19 aggregate to the Internet

17

Aggregation – Good Example

- Customer link goes down
  - their /23 network becomes unreachable
  - /23 is withdrawn from AS100's iBGP
- /19 aggregate is still being announced
  - no BGP hold down problems
  - no BGP propagation delays
  - no damping by other ISPs

- Customer link returns
- Their /23 network is visible again
  - The /23 is re-injected into AS100's iBGP
- The whole Internet becomes visible immediately
- Customer has Quality of Service perception

18

Aggregation – Summary

- Good example is what everyone should do!
  - Adds to Internet stability
  - Reduces size of routing table
  - Reduces routing churn
  - Improves Internet QoS for **everyone**
- Bad example is what too many still do!
  - Why? Lack of knowledge?
  - Laziness?

Separation of iBGP and eBGP

- Many ISPs do not understand the importance of separating iBGP and eBGP
  - iBGP is where all customer prefixes are carried
  - eBGP is used for announcing aggregate to Internet and for Traffic Engineering
- Do NOT do traffic engineering with customer originated iBGP prefixes
  - Leads to instability similar to that mentioned in the earlier bad example
  - Even though aggregate is announced, a flapping subprefix will lead to instability for the customer concerned
- Generate traffic engineering prefixes on the Border Router

20

The Internet Today (August 2012)

□ Current Internet Routing Table Statistics

- BGP Routing Table Entries   422061
- Prefixes after maximum aggregation   177317
- Unique prefixes in Internet   204324
- Prefixes smaller than registry alloc   148677
- /24s announced   220880
- ASes in use   41824

Efforts to improve aggregation

- The CIDR Report
  - Initiated and operated for many years by Tony Bates
  - Now combined with Geoff Huston's routing analysis
    - www.cidr-report.org
    - (covers both IPv4 and IPv6 BGP tables)
  - Results e-mailed on a weekly basis to most operations lists around the world
  - Lists the top 30 service providers who could do better at aggregating
- RIPE Routing WG aggregation recommendation
  - RIPE-399 — www.ripe.net/ripe/docs/ripe-399.html

Efforts to Improve Aggregation The CIDR Report

- Also computes the size of the routing table assuming ISPs performed optimal aggregation
- Website allows searches and computations of aggregation to be made on a per AS basis
  - Flexible and powerful tool to aid ISPs
  - Intended to show how greater efficiency in terms of BGP table size can be obtained without loss of routing and policy information
  - Shows what forms of origin AS aggregation could be performed and the potential benefit of such actions to the total table size
  - Very effectively challenges the traffic engineering excuse

Status Summary

Table History

Date	Prefixes	CIDR Aggregated
25-05-12	414357	242094

```

Importance of Aggregation

- Size of routing table
  - Router Memory is not so much of a problem as it was in the 1990s
  - Routers can be specified to carry 1 million+ prefixes
- Convergence of the Routing System
  - This is a problem
  - Bigger table takes longer for CPU to process
  - BGP updates take longer to deal with
  - BGP Instability Report tracks routing system update activity
  - bgpupdates.potaroo.net/instability/bgpupd.html

The BGP Instability Report

Receiving Prefixes

Receiving Prefixes

- There are three scenarios for receiving prefixes from other ASNs
  - Customer talking BGP
  - Peer talking BGP
  - Upstream/Transit talking BGP
- Each has different filtering requirements and need to be considered separately

Receiving Prefixes:
From Customers

- ISPs should only accept prefixes which have been assigned or allocated to their downstream customer

- If ISP has assigned address space to its customer, then the customer IS entitled to announce it back to his ISP

- If the ISP has NOT assigned address space to its customer, then:
    - Check in the five RIR databases to see if this address space really has been assigned to the customer
    - The tool: whois –h jwhois.apnic.net x.x.x.0/24
        - (jwhois queries all RIR databases)

Receiving Prefixes:
From Customers

- Example use of whois to check if customer is entitled to announce address space:

```
$ whois -h whois.apnic.net 202.12.29.0
inetnum:        202.12.28.0 - 202.12.29.255
netname:        APNIC-AP
descr:          Asia Pacific Network Information Centre
descr:          Regional Internet Registry for the Asia-Pacific
descr:          6 Cordelia Street
descr:          South Brisbane, QLD 4101
descr:          Australia
country:        AU
admin-c:        AIC1-AP
tech-c:         NO4-AP
mnt-by:         APNIC-HM
mnt-irt:        IRT-APNIC-AP
changed:        hm-changed@apnic.net
status:         ASSIGNED PORTABLE
changed:        hm-changed@apnic.net 20110309
source:         APNIC
```

Portable – means its an assignment to the customer, the customer can announce it to you

Receiving Prefixes:
From Customers

- Example use of whois to check if customer is entitled to announce address space:

```
$ whois -h whois.ripe.net 193.128.0.0
inetnum:        193.128.0.0 - 193.133.255.255
netname:        UK-PIPEX-193-128-133
descr:          Verizon UK Limited
country:        GB
org:            ORG-UA24-RIPE
admin-c:        WERT1-RIPE
tech-c:         UPHM1-RIPE
status:         ALLOCATED UNSPECIFIED
remarks:        Please send abuse notification to abuse@uk.uu.net
mnt-by:         RIPE-NCC-HM-MNT
mnt-lower:      AS1849-MNT
mnt-routes:     AS1849-MNT
mnt-routes:     WCOM-EMEA-RICE-MNT
mnt-irt:        IRT-MCI-GB
source:         RIPE # Filtered
```

ALLOCATED – means that this is Provider Aggregatable address space and can only be announced by the ISP holding the allocation (in this case Verizon UK)

34

Receiving Prefixes from customer: Cisco IOS

- For Example:
  - downstream has 100.50.0.0/20 block
  - should only announce this to upstreams
  - upstreams should only accept this from them
- Configuration on upstream

```
router bgp 100
 neighbor 102.102.10.1 remote-as 101
 neighbor 102.102.10.1 prefix-list customer in
!
ip prefix-list customer permit 100.50.0.0/20
```

Receiving Prefixes: From Peers

- A peer is an ISP with whom you agree to exchange prefixes you originate into the Internet routing table
  - Prefixes you accept from a peer are only those they have indicated they will announce
  - Prefixes you announce to your peer are only those you have indicated you will announce

Receiving Prefixes:
From Peers

- Agreeing what each will announce to the other:
  - Exchange of e-mail documentation as part of the peering agreement, and then ongoing updates

    OR

  - Use of the Internet Routing Registry and configuration tools such as the IRRToolSet

    www.isc.org/sw/IRRToolSet/

Receiving Prefixes from peer: Cisco IOS

- For Example:
  - Peer has 220.50.0.0/16, 61.237.64.0/18 and 81.250.128.0/17 address blocks
- Configuration on local router

```
router bgp 100
 neighbor 102.102.10.1 remote-as 101
 neighbor 102.102.10.1 prefix-list my-peer in
!
ip prefix-list my-peer permit 220.50.0.0/16
ip prefix-list my-peer permit 61.237.64.0/18
ip prefix-list my-peer permit 81.250.128.0/17
ip prefix-list my-peer deny 0.0.0.0/0 le 32
```

Receiving Prefixes:
From Upstream/Transit Provider

- Upstream/Transit Provider is an ISP who you pay to give you transit to the WHOLE Internet
- Receiving prefixes from them is not desirable unless really necessary
  - Traffic Engineering – see BGP Multihoming presentations
- Ask upstream/transit provider to either:
  - originate a default-route

        OR

  - announce one prefix you can use as default

Receiving Prefixes:
From Upstream/Transit Provider

- Downstream Router Configuration

```
router bgp 100
 network 101.10.0.0 mask 255.255.224.0
 neighbor 101.5.7.1 remote-as 101
 neighbor 101.5.7.1 prefix-list infilter in
 neighbor 101.5.7.1 prefix-list outfilter out
!
ip prefix-list infilter permit 0.0.0.0/0
!
ip prefix-list outfilter permit 101.10.0.0/19
```

Receiving Prefixes:
From Upstream/Transit Provider

- Upstream Router Configuration

```
router bgp 101
  neighbor 101.5.7.2 remote-as 100
  neighbor 101.5.7.2 default-originate
  neighbor 101.5.7.2 prefix-list cust-in in
  neighbor 101.5.7.2 prefix-list cust-out out
!
ip prefix-list cust-in permit 101.10.0.0/19
!
ip prefix-list cust-out permit 0.0.0.0/0
```

Receiving Prefixes:
From Upstream/Transit Provider

- If necessary to receive prefixes from any provider, care is required.
  - Don't accept default (unless you need it)
  - Don't accept your own prefixes
- For IPv4:
  - Don't accept private (RFC1918) and certain special use prefixes:
    - http://www.rfc-editor.org/rfc/rfc5735.txt
  - Don't accept prefixes longer than /24 (?)
- For IPv6:
  - Don't accept certain special use prefixes:
    - http://www.rfc-editor.org/rfc/rfc5156.txt
  - Don't accept prefixes longer than /48 (?)

Receiving Prefixes:
From Upstream/Transit Provider

- Check Team Cymru's list of "bogons"

  www.team-cymru.org/Services/Bogons/http.html

- For IPv4 also consult:

  www.rfc-editor.org/rfc/rfc6441.txt

- For IPv6 also consult:

  www.space.net/~gert/RIPE/ipv6-filters.html

- Bogon Route Server:

  www.team-cymru.org/Services/Bogons/routeserver.html

  - Supplies a BGP feed (IPv4 and/or IPv6) of address blocks which should not appear in the BGP table

Receiving IPv4 Prefixes

```
router bgp 100
 network 101.10.0.0 mask 255.255.224.0
 neighbor 101.5.7.1 remote-as 101
 neighbor 101.5.7.1 prefix-list in-filter in
!
ip prefix-list in-filter deny 0.0.0.0/0          ! Default
ip prefix-list in-filter deny 0.0.0.0/8 le 32     ! Network Zero
ip prefix-list in-filter deny 10.0.0.0/8 le 32    ! RFC1918
ip prefix-list in-filter deny 100.64.0.0/10 le 32 ! RFC6598 shared address
ip prefix-list in-filter deny 101.10.0.0/19 le 32 ! Local prefix
ip prefix-list in-filter deny 127.0.0.0/8 le 32   ! Loopback
ip prefix-list in-filter deny 169.254.0.0/16 le 32 ! Auto-config
ip prefix-list in-filter deny 172.16.0.0/12 le 32 ! RFC1918

ipv6 prefix-list v6in-filter deny 3ffe::/16 le 128         ! Old 6bone
ipv6 prefix-list v6in-filter permit 2000::/3 le 48         ! Global Unicast
ipv6 prefix-list v6in-filter deny ::/0 le 128
```

Receiving Prefixes

- Paying attention to prefixes received from customers, peers and transit providers assists with:
  - The integrity of the local network
  - The integrity of the Internet
- Responsibility of all ISPs to be good Internet citizens

Prefixes into iBGP

Injecting prefixes into iBGP

- Use iBGP to carry customer prefixes
  - don't use IGP
- Point static route to customer interface
- Use BGP network statement
- As long as static route exists (interface active), prefix will be in BGP

Router Configuration: network statement

- Example:

```
interface loopback 0
 ip address 215.17.3.1 255.255.255.255
!
interface Serial 5/0
 ip unnumbered loopback 0
 ip verify unicast reverse-path
!
ip route 215.34.10.0 255.255.252.0 Serial 5/0
!
router bgp 100
 network 215.34.10.0 mask 255.255.252.0
```

Injecting prefixes into iBGP

- Interface flap will result in prefix withdraw and reannounce
  - use "`ip route . . . permanent`"
- Many ISPs redistribute static routes into BGP rather than using the network statement
  - Only do this if you understand why

Router Configuration: redistribute static

- Example:

```
ip route 215.34.10.0 255.255.252.0 Serial 5/0
!
router bgp 100
 redistribute static route-map static-to-bgp
<snip>
!
route-map static-to-bgp permit 10
 match ip address prefix-list ISP-block
 set origin igp
<snip>
!
ip prefix-list ISP-block permit 215.34.10.0/22 le 30
```

Injecting prefixes into iBGP

- Route-map ISP-block can be used for many things:
    - setting communities and other attributes
    - setting origin code to IGP, etc
- Be careful with prefix-lists and route-maps
    - absence of either/both means all statically routed prefixes go into iBGP

Summary

- Best Practices Covered:
  - When to use BGP
  - When to use ISIS/OSPF
  - Aggregation
  - Receiving Prefixes
  - Prefixes into BGP

BGP Best Current Practices
